CHECK WEIGHERS

Check Weigher Scale Products

Due to the multitude of advanced features and programmable tolerance, using a check weigher scale is different than using a traditional scale. Here, at Union Special Medway, these particular scales are comprised of the highest quality stainless steel, making them extremely durable and more than capable of meeting product safety and regulatory standards. Moreover, these systems provide up to 100 weights per minute (higher speeds available), optional reject mechanisms, and accuracy to + 0.5 gram.

Purpose

As you may already be aware, the primary purpose of a check weigher scale is verifying the end product of the production process is accurate. Typically, a check weight scale utilizes three different kinds of conveyor belts—an infeed belt, a weigh belt, and a reject belt.

Application

Regarding applications, these systems can do more than just ensure the accurate target weight of a product or packaged item. In fact, these systems can detect missing pieces of a kit, count packs, provide total shipment weights and work with a controller computer to create barcodes, shipping labels and so on. Additionally, these scales can be used for streamlining quality management. From 10gms to 50 Kg's (models may vary depending on the speed and weight of the product).

The Benefits

It certainly is not surprising that the benefits of these systems include enhancing accuracy, reducing product giveaway, ensuring product quality, meeting regulatory requirements, tracking productivity and providing accurate data to streamline processes for your business.
